Abstract

This paper investigated the lecturers' job performance and students' wastage rate in Kwara state tertiary institutions Nigeria. Lecturer job performance and student wastage rate concepts were reviewed under which some indicators for measuring both variables were mentioned. The descriptive design of correlation type was adopted for this study which aimed at finding out the relationship between lecturers' job performance and students' wastage rate. Four out of the 8 tertiary institutions in Kwara State were selected using random sampling technique. Two researcher self-designed instruments were used for data collection which are a questionnaire tagged, "Lecturers' Job Performance Questionnaire" (LJPQ) from the respondents (Students and HODs) and a checklist tagged "Students' Wastage Checklist" (SWC). Also, test re-test method through a pilot study was employed to determine the reliability of the instrument which yielded coefficient values of .85 for (LJPQ). The research questions raised were answered using percentage while Pearson product-moment correlation coefficient was used to test the hypothesis formulated at 0.05 level of significance. The findings of the study showed that a significant relationship existed between lecturers' job performance and students' wastage rate ($p\text{-value} < 0.05$). However, it was recommended among others that wastage rate should be reduced to the barest minimum by ensuring that admission is based on merit. More so, the lecturers in the polytechnics should be encouraged to publish books and also improve their academic knowledge from time to time.

Keywords: *Lecturers' Job performance, Students' Wastage Rate, Tertiary Institutions.*

Introduction

Education has been referred to as the bed rock of the development of any society; this explains the recent emphasis on education, especially in a developing nation like Nigeria. This is manifested in the government programmes and policies on education which invariably have encouraged high enrolment rate and correspondent increase in expenditure that is, increased in aids from private and public sectors. Odekunle (2001), opined that education is widely accepted as a major instrument for promoting socio-economic, political and cultural development in Nigeria (Fafunwa, 1993).

Lecturers' job performance refers to the measure of the effectiveness of lecturers in relation to their roles and responsibilities in their work place. This is used to examine whether a lecturer performs their job as expected or not. Among the acceptable theories of job performance is the work of Campbell (1990) that describes job performance of an individual level variable that distinguishes him from more encompassing constructs such as organizational performance or national performance. Campbell's conceptualization of job performance gave more enlightenment to what lecturers' job performance means. Campbell (1990) said there are more factors that determine outcomes than just an employee's behaviours and actions.

According to Akfopure (2006), education is an important aspect in everyone's life. It is undeniable that education contributes toward ensuring development in a country. Thus, the educational system should be strategically planned in order to produce the best results for all concerned. The main actors in the education field are the lecturers, who may be termed as teachers, tutors, faculty members or facilitators. Regardless of the title, or the institutions where they work, the educators shoulder heavy responsibilities in educating the students. According to Taiwo (2014) describes job performance as work-related activities expected of a lecturer and how well those activities are executed. Hence, the lecturers' job performance can be measured through the following:

1. Teaching
2. Research and Publication
3. Community Services.

Akinnubi (2010), pinpointed that the combination of strategic planning and resource utilization could bring about low wastage rate and high graduation rate in the Nigerian tertiary institutions. It is in light of this realization that the institutions have, over the years, been encouraged to embrace strategic planning and resources utilization as a means of improving management of human and material resources available to them for maximum attainment of their institutional goals. Nigerian tertiary institutions need a well-planned programme that could make them compete favourably with other institutions outside the country based on current high rate of unemployment and the desire for more effective utilization of human resources as well as the necessity for technological advancement.

Adesina (1994) pointed out that there are three forms of wastage, the year-by-year drop out of pupils, the ultimate failure at the examination of those who survive up till the final year when the examination is taken and the year-by-year repetition of students. Abimbola (2003) also asserted that educational wastage could result from insufficient vacant places in the next class or in the next level of schooling for students who want to continue schooling. Wastage could also result from school spaces remaining fulfilled, because a large number of students fail to continue at school. Durosaro (1989) noted that factors influencing wastage in school include financial difficulties of parents, dismissal of students, withdrawal of students from school to seek employment, death, pregnancy in female and illness of students. Also, dismissal of students for disciplinary purpose, and academic incompetence of students had significant relationship with students' wastage in tertiary institutions. Abimbola (2003) went further to explain that drop-outs interfere or even hinders the achievement of stated objectives in the development plan of the educational system. This is so because neither the educational planners nor the economists can estimate number of needed classrooms, facilities and manpower output at various skill levels since many people do not complete given stages of their education.

Indicators reflect the way in which an objective can be achieved as well as to what degree approximately the objective has been achieved at any stage. The indicators of students' wastage rate are enunciated below:

Lecturers' Job Performance & Students' Wastage Rate

- a. Wastage rate: it is used to describe uncertificated school leavers, who left school system before the completion of the course, wastage may also occur between grade level, that is, those students who repeated the grade and those who drop out of the system between the grade levels or before the completion of the cycle.

$$W_g^t = \frac{E_g^t - P}{E_g^t} \times 100$$

Where: W_g^t = Wastage rate

E_g^t = Enrolment at a given grade level.

P = Number of promoters

- b. Refined cohort wastage rate: This is the relationship between those who passed out or the graduates and the enrolment at the cohort. This is based on the basic fact that not all that reached the final year took the final year examination or passed.

$$RCWR = \frac{E_g^t - G}{E_g^t} \times 100$$

Where: E_g^t = number of enrolment at year t in class g

G = graduates

E = total enrolment

- c. Repetition rate: This refers to the number of students who repeat a grade in the succeeding year as a percentage of the original enrolment in the same grade. It could be defined mathematically as:

$$R_g^t = \frac{R_g^t + 1}{E_g^t} \times 100$$

$R_g^t + 1$ = number of students repeating class g in year t+1

E_g^t = total number of students in class g in year t

- d. Dropout rate: It refers to the number obtained when relating the number of students who withdraw from the system as a percentage of others in the class. This implies the students who are

Lecturers' Job Performance & Students' Wastage Rate

unaccounted for after deduction of the numbers promoted to the next class and the number meant to repeat from the total enrolled in the class.

$$D_g^t = \frac{E_g^t - (R+P)}{E_g^t} \times 100$$

Where: D_g^t = refers to the dropout rate

E_g^t = refers to the enrolment in year t in class g

R = refers to repeaters in year t+1 in class g+1

P = refers to promoters.

- e. Graduation rate: refers to the percentage of the students enrolled in the final grade of the level that finally leaves the system on completion of the course. This is very vital to the work of educational planners because it enables them to compute the input-output ratio in determining the efficacy of the system.

$$G_R^t = \frac{E_g^t - R_g^t}{E_g^t} \times 100$$

G_R^t = enrolment at the final year in year t in class

R_g^t = number repeating the final year in year t in class g

For the purpose of this study, these formulae would be used to compute the student wastage rate.

Statement of the Problem

In Nigerian tertiary institutions, the issue of wastage rate has been a sensitive one (Oyetakin & Odunayo, 2013). More often than not, the curricula developed by Nigerian tertiary institutions are more theoretical than practical as they are not well adapted to the needs and aspirations of the society which they serve (Odey & Opoh, 2015).

Thus, the achievement of students does not commensurate with how well they are able to apply their theoretical knowledge to the real life situations in their career or field of studies. Consequently, students with good grades are almost unable to defend their certificates as they find it difficult to relate their theoretical knowledge to solving the practical issues in the society. This is a basic issue at the

Lecturers' Job Performance & Students' Wastage Rate

tertiary level of the Nigerian education system. Students often drop out from school in a bid to look for greener pastures and better opportunities to improve their standard of living. This research is therefore, aimed at finding out the influence of lecturers' job performance on students' wastage rate in Kwara State tertiary institutions.

Purpose of Study

This work explored the relationship between lecturers' job performance and students' wastage rate in Kwara state tertiary institutions. Specifically, the purposes of the study are:

- To determine students' wastage rate in Kwara state tertiary institutions.
- To examine the relationship that exists between lecturers' job performance and students' wastage rate in Kwara state tertiary institutions.

Research Questions

Based on the research objectives two, the question was raised to guide the study:

- What is the wastage rate in Kwara State tertiary institution for 2007 cohort?

Hypotheses.

The following research hypotheses were raised:

Ho₁: There is no significant relationship between lecturers' job performance and students' wastage rate in Kwara state tertiary institutions.

Ho₂: There is no significant relationship between lecturers' job performance and drop-out rate in Kwara state tertiary institutions.

Ho₃: There is no significant relationship between lecturers' job performance and repetition rate in Kwara state tertiary institutions.

Conceptual Framework

The school as an organization involves human and material resources in which their efficient and effective mobilization can only guarantee attainment of stated goals and objectives. However, job performance is a phenomenon which cannot be ruled out in the school. The school administrator then needs to explore various strategies that could help in improving lecturers' job performance in the school system to bring about high productivity. Teaching, research and publication and community services are tools that determined lecturers' job performance in Nigerian tertiary institutions. The aforementioned statement is supported by the conceptual model in figure 1.

Figure 1: Conceptual model on Lecturers' job performance and Students' wastage rate.

Source: Researchers self-designed

Research Design

The research design used for this study was descriptive survey which aimed at finding out the influence of lecturers' job performance on students' wastage rate. This was considered suitable for this study, in view of the fact that it allowed the researcher to make careful record of what was observed in such a way that information obtained from a representative sample of the population was analyzed, while the situation was described as it existed on lecturers' job performance and students' wastage rate in Kwara state tertiary institutions.

Population, Sample and Sampling Techniques

The population for this study covered eight tertiary institutions in Kwara state. For the purpose of this study, 4 out of the 8 tertiary institutions in Kwara State were selected using random sampling technique. Twenty five students and twenty five HODs from each institution were also randomly selected. This made the total sampled size to be 200 participants.

Research Instruments

The research instruments used for data collection were a self-designed questionnaire tagged, "Lecturers' Job Performance Questionnaire" (LJPQ) to gather information on lecturers' job performance from the respondents (Students and HODs). The questionnaire consists of two parts. The first part to be completed by students with 5 items on lecturers' teaching performance and second part to be filled by HODs with 10 items on lecturers' research-publications and community services performance and a checklist tagged "Students' Wastage Checklist" (SWC) was equally used to collect relevant data from the respondents. SWC was divided into two sections A and B. Section A obtained data on student wastage in terms of total number of students attended to per lecture and total number of lecturers in the department, while section B obtained data on students' enrolment from 2007/2008 to 2009/2010 academic sessions..

Experts in the field of educational management and Test and Measurement assisted to assess the face and content validity of the questionnaire by ensuring that irrelevances and ambiguous items were eliminated. Test re-test method was adopted through a pilot study undertaken to ascertain the reliability of the questionnaire within the time frame of two weeks. The data collected were subjected to Pearson product-moment correlation statistic which yielded .85 coefficients. The instrument was adjudged reliable.

Data Collection

The researchers administered copies of the instruments designed on the respondents of the sampled institutions in Kwara state, Nigeria and collected back from the respondents after supplying the necessary information.

Data Analysis

Data gathered from the respondents on lecturers' job performance and students' wastage rate in Kwara State tertiary institutions were statistically analyzed using Statistical Package for Social Science (SPSS). Frequency counts and percentage were used to analyze the research question raised in the study. Pearson product moment correlation statistic was used to test all the hypotheses formulated in the study. All hypotheses were tested at .05 level of significance. With the above procedures, the level of relationship that existed between the study variables was determined.

Results

- What is the wastage rate in Kwara State tertiary institution for 2007 cohort?

Based on the research question raised, the following analysis and discussion was made as shown in Table 1.

Table 1

Wastage rate in Kwara state tertiary institutions (2007-2009)

S/No	Institutions	100	200	300	400	GRAD	WR(%)
		HND1	HND2				
1	Federal Polytechnic, Offa	10,750	9121	—	—	7957	26
2	Kwara State College of Education, Oro	3721	3320	3106	—	2903	22
3	Kwara State Polytechnic, Ilorin	5003	4275	—	—	3993	20
4	University of Ilorin, Ilorin	—	3720	3101	2817	2693	28
	Total						96
	Mean						24

Key: HND = Higher National Diploma, GRAD = Graduated, WR = Wastage Rate

Table 1 shows wastage rate in Kwara State tertiary institutions. The mean wastage rate stood at 24%. This implies that wastage rate appears low but for tertiary institutions, it is unexpected because these are adults and they should be able to work independently without their lecturers though they still need the guidance of the lecturers. It is expected of them to sit tight face their studies and work hard without been chased around by their lecturers like the secondary or primary school students/pupils because they are matured students. The wastage rate for tertiary institutions is expected to stand at 0.1 level or at most 1%. Therefore, the wastage rate in Kwara State tertiary institutions is too high and efforts should be made by both lecturers and students in order to reduce it to the barest minimum. Adesina (1994) said in his opinion that there are three forms of wastage, the students that drop out year-by-year, those who cannot survive the final year examination and have to drop out and the students that repeat their class every year. Wastage in education happens as a result of low promotion rate, high repetition rate and high dropout rate. It presupposes that if education managers carefully and effectively handle educational resources, better result would be achieved. Fadipe (1992) found out that the quality of the input always influences the output of the school system. This may be one of the reasons why the wastage rate in Kwara state tertiary institutions is just fair and not the best because the quality of students enrolled will determine the quality of the output, when admission process is monitored and quality students are admitted into the institutions the wastage rate will be reduced to the barest minimum. Thus, educational planners and administrators have the responsibility of decreasing educational wastage.

Hypothesis Testing

Ho₁: There is no significant relationship between lecturers' job performance and students' wastage rate in Kwara State tertiary institutions.

Table 2

Lecturers' Job Performance and Students' Wastage Rate in Kwara State Tertiary Institutions

Variables	N	r	p-Value	Decision
Lecturers' Job Performance	100	.678	.03	HO₁ Rejected
Students' Wastage Rate	100			

***Significant $p < 0.05$**

Result from Table 2 shown the Pearson correlation analysis value yielded 68% which is positive relationship with P value $.030 < 0.05$. Hence, the hypothesis one was rejected. This implied that a positive significant relationship existed between lecturers' job performance and students' wastage rate. In order words, lecturers' job performance has a lot to do with the wastage rate in tertiary institutions though all the blame cannot be put on the lecturers because the students are sometimes not serious with their studies which can lead to high wastage rate. Hence, the lecturers can help reduce wastage rate by being faithful to their job through punctuality to class, students assessment and by contributing to the existing knowledge through their research and publications and community services. Afolabi (2006) was of the opinion that lecturers at higher education level are employed to impart knowledge and to contribute to the existing knowledge through research and publications and community services.

Ho₂: There is no significant relationship between lecturers' job performance and drop-out rate in Kwara State tertiary institutions.

Table 3

Lecturers' JOB performance and Drop-out Rate in Kwara State Tertiary Institutions

Variables	N	r	p-Value	Decision
Lecturers' Job Performance	100	.872	.041	HO₁ Rejected
Drop-out rate	100			

***Significant $p < 0.05$**

Result from Table 2 shown the Pearson correlation analysis value yielded 82% which is positive relationship with P value $.041 < 0.05$. Hence, the hypothesis one was rejected. Thus, the Ho₂ was rejected. This implies that a significant relationship existed between lecturers' job performance and drop-out rate in Kwara State tertiary institutions. Abimbola (2003) explained that drop-outs interfere or even hinder the achievement of stated aims and objectives in the development plan of the educational system. This happened because not even the educational planners or the economists can estimate number of needed classrooms, facilities and manpower output at various skill levels since many students do not complete given stages of their education.

Ho₃: There is no significant relationship between lecturers' job performance and repetition rate in Kwara State tertiary institutions.

Table 4

Lecturers' Job Performance and Repetition Rate in Kwara State Tertiary Institutions

Variables	N	r	p-Value	Decision
Lecturers' Job Performance	100	.732	.004	HO₁ Rejected
Repetition Rate	100			

***Significant $p < 0.05$**

Result from Table 4 shown the Pearson correlation analysis value yielded 82% which is positive relationship with P value $.041 < 0.05$. Hence, the hypothesis one was rejected. Thus, the Ho₂ was rejected. It, therefore, indicates that the Ho₃ is rejected. It can be submitted based on the results in Table 4 that a significant relationship existed between lecturers' job performance and Students' repetition rate. The repetition rate in Kwara State tertiary institutions could be as a result of the job performance of lecturers, when lecturers fail in their duties by not being punctual in the class, not giving frequent assessment to students and so on. FRN (2004) stated that no quality of teaching can rise above the quality of its teacher. Likewise the students can also be responsible for the high repetition rate in tertiary institutions by involving in cultism, truancy, students union government and so on which will not allow them to concentrate on their studies. Therefore, the responsibility of reducing the repetition rate in tertiary institutions lies in the hand of both the lecturers and students.

Conclusion

Based on the outcomes of this research, it was summarised that lecturers' job performance had a positive significant and high relationship with students' wastage rate. Lecturers' job performance had a significant relationship with drop-out rate and repetition rate.

It was also concluded that there were low wastage and high graduation rate in the sampled Kwara State tertiary institutions. Lecturers' job performance is a detailed roadmap which enables an

institution to reduce the drop-out and repetition rate of students in order to achieve the educational aims and objectives. Education is both consumer and capital goods that is beneficial to individual in a country. Stakeholders in education need to put in their best towards the development of tertiary education in Kwara State.

Recommendations

Based on the findings of the study, the following recommendations were raised:

1. There should be reduction of wastage rate the barest minimum by admitting students on merit. If this is done, the issues of drop-out and repetition would be efficiently and effectively managed in Kwara State tertiary institutions.
2. Lecturers should be more committed to their job through punctuality to class, constant assessment of students, assignment and projects in order to enhance students' academic performance which can result in low wastage rate in Kwara State tertiary institutions.
3. More emphasis should be laid on programmes that are not given much attention in the community such as seminars and keynote addresses by lecturers in Kwara State tertiary institutions.
4. Publications by lecturers' should be made available for students in order to improve their academic performance and reduce the wastage rate in Kwara State tertiary institutions.
5. The lecturers in the polytechnics should be encouraged to publish books and also improve their academic knowledge from time to time.
